Talked at GDSC WoW Pune event yesterday, on #chatgpt. Packed audience. It was encouraging to see how the student community is embracing the new technologies, wholeheartedly.

On the other hand, some renowned folks (and even countries) are advocating ban/halt on the further development of LLMs (Large Language Models) like GPT (Generative Pretrained Transformer), at least for some time.

I do get their argument as well, but looking the momentum and wide adoption, its going to be extremely challenging to put any breaks on it's progress. After all you can not stop matrix multiplication, right?

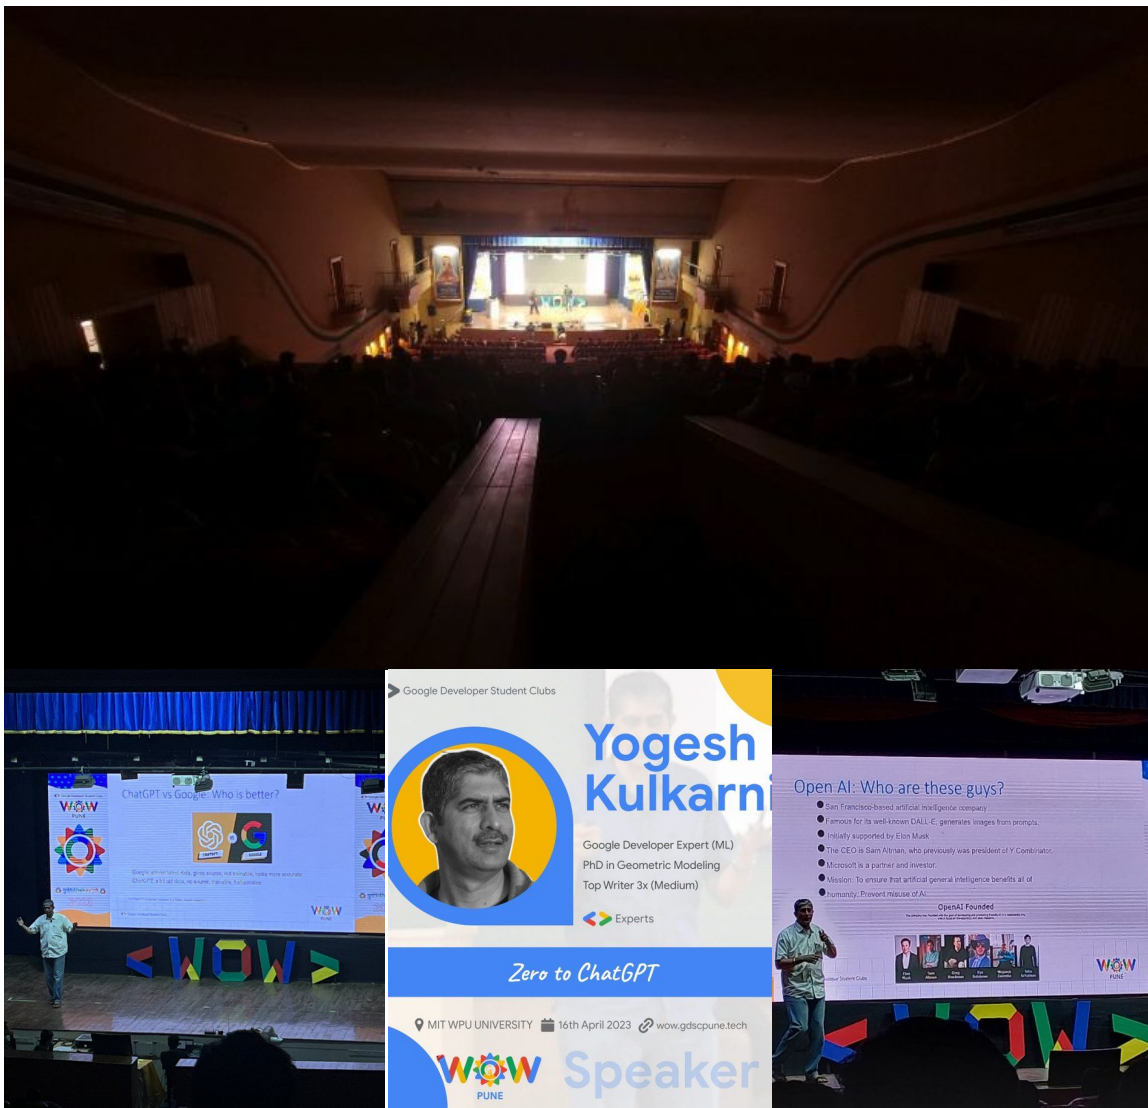

The significance of ChatGPT is just not that it gives human like answers, but it brings a very intuitive and effective way to interface with data/information, in not extractive/query but generative manner, a radically new approach. It is a new UX (User Experience) democratizing wider acceptance of technology and even technology development, like, as Andrej Karpathy said "The hottest new programming language is English."

Bans/halts don't help, don't succeed. Channelizing, putting strong guard-rails, may. What do you think?

My generation will remember there was attempt to ban calculators, as students would lose ability to use Log tables. You can see what happened next!!
