Recently came across various interviews by Dr. Ankit Shah and was captivated by his expertise, clarity, and of course, his logical predictions. As someone who is new to geopolitics, I'm not in a position to evaluate them, but they seem plausible, albeit somewhat dramatic.

Here are a few highlights:

☀️ A financial RESET in the US is predicted for 2025, with fewer jobs, pay cuts of up to 60%, a real estate wipeout, and a bleak future for students there. However, companies will invest in India.

☀️ The Arctic ice will melt, exposing minerals. Russia will claim them along with all those routes. As the US and China slow down, Russia will dominate, and India will rise.

☀️ Deep-state/globalists are profit-driven, so they're looking for consumer markets, and that's India and the East in general. Thus, the flow of wealth will be from West to East.

☀️ De-dollarization will begin, and a new multi-currency system, say BRICS+, will emerge along with a strong Rupee, once the treasury bonds of all other major nations are ready. We'll see the end of fiat currencies and the rise of pegged currencies.

☀️ IT salaries and opportunities in US-India will decline, but we'll see a boom in agri-tech, space-tech, defense-tech, and manufacturing. New markets such as Russia, the Middle East, and Southeast Asia will become more prominent than the traditional US and Europe.

☀️ Radicalization will decrease, and we may see religious reorientation, especially in the Middle East, as that will enable them to survive once petrol runs out.

☀️ In 2024, India will elect a global leader, not just a national one,

with the foreign minister becoming the next most powerful person.

My personal take on all this is that Indian education, especially engineering, is heavily skewed towards computer science. This needs to change and reorient itself towards more core branches to thrive in the times ahead. Knowing programming and AI will be taken for granted and not considered a special skill.
