🤖 Building Your Own ChatGPT-like Bot 🛠️

Have you ever wondered how to create a ChatGPT-style chatbot that responds based on your own data? 🧠 💬 Well, here's a simple workflow that lets you craft your very own bot - a bot that builds bots!

The process is surprisingly intuitive. The wizard guides you through essential steps, prompting you to input details like the bot's name, training data files, and more. In just seconds, you'll have a functional bot up and running. While this proof-of-concept operates on a smaller scale, the potential for scaling up to an enterprise-level application is undeniable.

🎥 Curious to see it in action? Check out the video showcasing the creation of the same GST FAQs bot shown last time. But don't stop there – experiment with your own domain files! You can find sample code in the GitHub repository under yogeshhk/Sarvadnya/tree/master/src/generate_faq_bot.

I'm eager to hear about your experience with this workflow. If you manage to get it working, that's truly remarkable! Share your insights and progress – your feedback could be invaluable.

And here's an interesting twist: while the example currently utilizes Vertex AI PALM APIs, don't hesitate to swap them out for your preferred language models available at LangChain.

🌟 This weekend, why not embark on a captivating project? This workflow isn't just for students; it's an exciting endeavor for Generative AI enthusiasts and professionals alike.

🚀 Step-by-step explanation of the code is being made available as a Medium story, soon. Will add link to it in the comments, then.

Feel free to share your thoughts. 📢
