now • 🌐

Many approach me for advice or discussion regarding their mid-career transition to data science or artificial intelligence, obviously for better prospects. Although it's still not possible to replace human interaction on such topics, you can leverage prompts to generate a first draft, serving as input for further brainstorming. Here is a prompt I can think of...

"""

You are an expert career coach. Please suggest the next steps for a <your age>-year-old <current role> with a <educational degree> background.

According to Naval Ravikant's concept of Specific Knowledge, a unique, untrainable skill helps. It typically involves a combination of two diverse fields: one can be your current domain and the other being Data Science or AI, the desired transition.

Here are keywords representing both fields:

Field 1: <keywords related to your current domain, such as CAD software development, geometric modeling...>
Field 2: <keywords related to your target domain, such as AI, ML, NLP, Deep Learning, Generative AI...>

Based on the overlap of these fields, several combination fields can be identified, they are:

Combinations: <specific overlapping domains, such as AI for

Manufacturing, 3D + LLM...>

These combinations options should be critically analyzed using the IKIGAI concept, evaluating each option based on four criteria: what-you-love, what-you-are-good-at, what-world-needs and what-world-is-ready-to-pay. Additionally, new relevant combination options can also be suggested. Lets think step by step. Take your own time to rank these options based on future prospects and provide me a 5-point action plan, outlining a roadmap to achieve the selected options.
"""

Feel free to try this prompt with any of your preferred LLMs, such as ChatGPT, Claude, Gemini, Perplexity or others, and share your experience. Modifications to the prompt and reposting this post further, are welcome.
