Seeing is believing

AI, though powerful and effective, is not perfect at all.

AI makes mistakes and if being used for critical applications such as health-care, autonomous cars, can be disastrous. Another problem is that, AI models (say, neural networks) are predominantly black-boxes, making it hard to 'see' what's going on, in case they don't work.
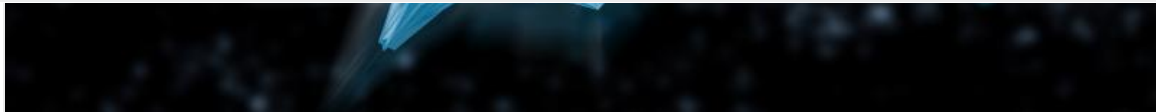

Came across this interesting article by Ben Dickson, talking about peeping inside the neural networks.
