India isn't just adopting AI anymore. It's building the foundation for becoming an AI powerhouse.

The IndiaAI Mission is one of the most ambitious national AI programs currently underway, combining compute infrastructure, indigenous foundation models, datasets, startup funding, AI safety, and large-scale skilling into one connected ecosystem. What makes it interesting is the systems thinking behind it:

- Compute access
- Open datasets
- Indian foundation models
- Talent pipelines
- Startup acceleration
- Responsible AI frameworks

Instead of treating AI as just another technology wave, the mission tries to build long-term national capability. A particularly important shift:

India moving from being only an AI consumer → becoming an AI creator nation.

I converted the entire initiative into a sketchnote style visual to simplify the big picture and make the ecosystem easier to understand at a glance.

Sometimes visuals explain strategy better than 20-page documents.
