AI Advisor (Helping organizations in their AI journeys) | PhD (Geometric Modeling) | Tech Columnist (Marathi) | ...

19m •

Recently recorded a (Hindi + English) podcast conversation around AI, engineering, careers, research, and where all this is heading.

The discussion moved across quite a few layers of AI, like:

- Career transitions into AI after decades in another domain.
- How non coders can still contribute meaningfully.
- Why enterprise AI projects become messy despite good intent.
- Whether vibe coding is weakening engineering fundamentals.
- What AI is realistically replacing and what it still struggles with.

One topic I particularly enjoyed discussing was spatial reasoning and geometry. Today's models can generate text, code, music, and video surprisingly well. But once problems become physical, geometric, or spatial, the limitations start showing quickly.

We also spoke about India specific AI challenges, especially language, culture, and context beyond English centric systems.

The podcast is now published. Sharing it here for anyone curious about the technical as well as human side of AI.
