AI is everywhere. But are there areas that will not just survive, but actually thrive in an AI first world? Being Anti-Fragile per Nassim Taleb 🤔

We are seeing a collapse of the traditional build layer. Tools like [Lovable](#), [Replit](#) and others can turn prompts into apps in seconds. When everyone can build, building itself stops being the moat. Your UI can be replicated in a week. Your feature can be cloned overnight.

So what actually lasts?

The future of the web seems to organize around five durable concepts that AI cannot easily replace.

First is Trust. 🌐

When millions of AI generated apps flood the web, verification becomes gold. Signals like payment reliability, platform credibility and identity assurance matter more. Trust becomes the routing layer for both humans and agents.

Second is Context. 🗂️

AI without your data is just a chatbot. AI with your company data becomes a teammate. Platforms that own structured context and permission layers become critical choke points.

Third is Distribution. 🔊

Building is easy. Getting discovered is hard. When supply becomes infinite, curation becomes scarce. Gatekeepers and niche creators both gain power in the attention economy.

Fourth is Taste. 🎨

When production is free, choosing what to build becomes the real skill. Human judgment, product sense and orchestration quality define winners. AI assists, but taste directs.

Fifth is Liability. ⚖️

When AI makes decisions, someone must be accountable. Healthcare, finance, legal and governance layers will grow because responsibility cannot be automated away.

The key question for builders today is simple: What do you own that becomes more valuable when AI gets better?

If the answer is nothing, rethink your positioning. If the answer is trust, context, distribution, taste or liability, you are building on durable ground.

AI is not removing these fundamentals, the domain expertise. It is amplifying them. 🚀
