AI coding assistants are everywhere, but using them effectively is still a skill. I have been using Claude Code for a while now, but taking a proper course helped me understand its full range. Give it a try at <https://lnkd.in/dyTFqbB4>. The course itself is free.

Claude Code, per se, is not free. It comes under the Pro and Max plans, but honestly, it feels worth it. ₹2k per month is quite reasonable, IMO. 💡

What I liked is that the course does not just focus on prompting. It explains how AI coding assistants actually work. You get a good understanding of tool integration, codebase analysis, and how these systems safely modify projects. That context alone changes how you use them.

The section on context management is especially useful. It shows how to keep conversations relevant, reference project resources, and guide the assistant for more accurate output. Less noise, more usable code.

There is solid coverage of Hooks, MCP servers and GitHub integration too. Automating repetitive tasks, setting up AI assisted code reviews, and extending functionality becomes much more practical. 🚀

If you are comfortable with CLI and Git basics, you are good to go.

For developers serious about AI assisted workflows, I would definitely suggest trying it. ₹2k per month feels like a small price for the productivity boost.
