Ever wondered what would happen if an AI could quietly scan your software and find bugs no one noticed for years?

That's the kind of capability new AI systems are beginning to show. Think of it as a super-auditor that can uncover hidden flaws faster than any human team.

Sounds great for security... until you flip the perspective.

The same AI that helps fix vulnerabilities can also expose them. And if access to such powerful tools is limited, the real question isn't just what it can do but who gets to use it first.

For banks and other critical systems, the concern is not just technology. It's timing, access, and trust. Because when weaknesses can be discovered instantly, even a small delay in access can increase risk.

💡 AI is shifting power. Security may soon depend more on access than capability.

Tried to capture this idea in a simple comic (below) ...

What do you think? 👉 Should powerful AI tools be widely accessible or tightly controlled?

Who should get early access to powerful AI tools?

- ➡ Big tech companies
- ➡ Governments/regulators
- ➡ All organizations equally
- ➡ No one until fully tested

(Note: The image is generated using AI by providing the idea and a detailed prompt.)

THE AI THAT FINDS WHAT YOU MISSED
